This is a brand new, affordable OE Specification replacement product. 100% Factory tested and built to strict quality control standard to ensure high performance and guaranteed to deliver better fuel economy. Above picture for illustration purposes only.

Product Description

An automotive charging system is made up of three major components: the battery, the voltage regulator and an alternator. The alternator works with the battery to generate power for the electrical components of a vehicle, like the interior and exterior lights, and the instrument panel. An alternator gets its name from the term alternating current (AC). Alternators are typically found near the front of the engine and are driven by the crankshaft, which converts the pistons' up-and-down movement into circular movement. Alternators produce AC power through electromagnetism formed through the stator and rotor relationship. The electricity is channelled into the battery, providing voltage to run the various electrical systems.

?

Defective Symptoms

Alternators work tirelessly to produce electricity for the modern vehicle is subject to great wear and tear so it's not uncommon for an alternator to fail. It's quite easy to tell when they fail as they always warn you.

1. Dimming headlights - If your headlights dim when you turn them on, it could be a sign of a failing alternator.

2. Battery issues - If your battery is constantly going dead, it could be a sign of a failing alternator. If the battery comes on, the battery is fairly new and holds a charge well when tested, and you've ruled out an electrical short, then the problem might be the alternator.

3. Noisy - Inside the alternator are several parts that spin in order to produce the electrical current. When these parts become worn or break, the result is noise. It usually sounds like a rattling or clanging. Listen closely when the alternator is operating to see if you can notice any unusual sounds.

4. Dimmed Slowed Accessories - If your car's accessories, like the power windows or the radio, are dimming or slowing down, it could be a sign of a failing alternator.

5. Burning Smell - If you notice a burning smell coming from the engine compartment, it could be a sign of a failing alternator. This is a serious issue and should be addressed immediately.

6. Voltage Fluctuation - If you notice the voltage fluctuating, it could be a sign of a failing alternator. This is a serious issue and should be addressed immediately.

7. Battery Light - If the battery light on your dashboard is lit, it could be a sign of a failing alternator. This is a serious issue and should be addressed immediately.

Normally, when you turn on any accessory such as the dashboard lights, radio or blinkers, the accessory is powered indirectly by the alternator, which keeps the battery charged. When the alternator is bad, however, it cannot produce enough electricity to operate all electrical accessories at maximum capacity. The dash and headboard lights thus may dim, signal lights may operate slowly and music players may not function.

Jumps

The alternator is responsible for keeping the charge of the battery high. When it doesn't operate properly, the battery voltage may drop too low to start the car. If you find that your car has needed jumps lately or that it frequently goes completely dead, then the alternator may be the.
