Product Description

An automotive charging system is made up of three major components: the battery, the voltage regulator and an alternator. The alternator works with the battery to generate power for the electrical components of a vehicle, like the interior and exterior lights, and the instrument panel. An alternator gets its name from the term alternating current (AC). Alternators are typically found near the front of the engine and are driven by the crankshaft, which converts the pistons' up-and-down movement into circular movement. Alternators produce AC power through electromagnetism formed through the stator and rotor relationship. The electricity is channelled into the battery, providing voltage to run the various electrical systems.

?

Defective Symptoms

Alternators work tirelessly to produce electricity for the modern vehicle is subject to great wear and tear, so it's not uncommon for an alternator to fail, and it quite often, they always wear out.

These vehicles have a light that sometimes comes on the dashboard to indicate a failure. If it comes on, the battery is fairly new and holds a charge well when tested, and you've ruled out an electrical short, then the problem might be the alternator.

Inside the alternator are several parts that spin in order to produce the electrical current. If these parts become worn or break, the result is noise. It usually sounds like a rattling or clang. Listen closely when the alternator is operating to see if you can notice any unusual sounds.

Dimmed/Slow Accessories

When the alternator is not producing enough power, the vehicle's accessories will not work as well as they should. This can include things like the radio, air conditioning, and windows. If you notice that your vehicle's accessories are not working properly, it may be time to replace the alternator.

When these symptoms occur, it's important to have the vehicle checked by a professional technician. They can determine the cause of the problem and recommend the best course of action.

Normally, when you turn on any accessory such as the dashboard lights, radio or blinkers, the accessory is powered indirectly by the alternator, which keeps the battery charged. When the alternator is bad, however, it cannot produce enough electricity to operate all electrical accessories at maximum capacity. The dash and headboard lights thus may dim, signal lights may operate slowly and music players may not function.

Jumps

The alternator is responsible for keeping the charge of the battery high. When it doesn't operate properly, the battery voltage may drop too low to start the car. If you find that your car has needed jumps lately or that it frequently goes completely dead, then the alternator may be the.
