Check out this video to see what this device is all about: https://m.youtube.com/watch?v=GrutyqRhbnQ

  This is essentially the innards of an Android Tablet with one exception. It is lightening fast due to the 1.8 Ghz Quadcore Processor. It has an HDMI interface which can be plugged into any large or small Flatscreen HD TV or monitor. HDMI to VGA adaptors are available. The highest screen resolution is 1920 X 1080 both 50 & 60Hz. This device has built in Wi-Fi, Bluetooth, one standard size USB input and 2 X micro USB inputs. The standard sized USB is used for a mouse or preferably a cordless mouse & keyboard. The unit has an onscreen keyboard which can be disabled in place of a wireless keyboard and mouse. One of the micro USBs is used to power the device either by a supplied UK power supply or via the USB port on the TV. The other micro USB can be used for any USB peripheral. Lastly the unit has a slot for a micro SD card up to 32GB. I can supply most of the bits and pieces. What makes the device so special beside it's slick performance is the fact it can be configured and used as a desktop computer. Several free Apps are available that are compatible with the Microsoft Office Suite. Try opening a spreadsheet on a tablet. That is a non starter on a small screen. With the larger screen size possible here...no problem. There is very little that you cannot do in this device that you can do on a Windows or Mac desktop. Surf the web, send and receive emails, interact on social media and watch.
