WHAT IS TERMINATION?

The information pills should be taken by the morning after you have sex as it is needed for use within the first few weeks of pregnancy. Whereas the morning after pill can only be used within 72 to 5 days after intercourse. The term of use of mifepristone and misoprostol is 49 approved pregnancy term as a method in South Africa and can only be prescribed by a medical doctor..

HOW DOES TERMINATION PILLS WORK?

Both termination pills, Mifepristone and Misoprostol, are usually used in order to terminate a pregnancy. Mifepristone causes the embryo to detach from the uterus thereby cutting off essential nutrients and oxygen carried by the blood. Misoprostol is then taken two days later and triggers the evacuation of the embryo remnants through the womb. This often appears as a heavy period.

It is advisable that you consult with your medical practitioner for a further understanding of how the

termination pill works.

IS TERMINATION PILLS SAFE?

The termination pill is usually safer than surgical termination but should only be considered in the first 12 weeks of pregnancy. Like any procedure, use of the termination pill can result in complications but if used under the supervision of a medical doctor, the chances of complications are greatly reduced. Your doctor will be best suited to handle any complications should they arise.
